

L3AI turns Web3 uncertainty into a guided product journey

Product story, commercial logic and trust boundary for external review

面向外部评审的产品叙事、商业逻辑与信任边界

What changed

This deck replaces a documentation-style roadshow draft with a product-led business story.

Current public assets only

The buyer problem is not access. It is confidence.

Web3 users and partners can find data everywhere. The hard part is deciding what to trust, what to ignore and what to do next.

Fragmented signals

Market context, product claims, wallet state and community narratives arrive in different places.

High-risk decisions

Users need boundaries before conversion. They should understand limitations before action.

Weak public proof

Many projects lead with documents or hype before showing a coherent product experience.

L3AI's wedge is not more noise. It is a clearer journey from context to evaluation.

L3AI sells clarity before conversion.

The public product experience is designed to help a reviewer understand the platform, its limits and the next qualified action.

Commercial implication: trusted context creates a better path to partner review, education-led community growth and product-qualified conversations.

The platform journey starts with product to resources.

The live public site gives reviewers a route before asking them to

- 1

Start at the product surface

Visitors see the live homepage, product proof and audience paths.
- 2

Move into product modules

AI Quant, wallet-aware education, trust and roadmap pages explain the offer.
- 3

Open resources only after context

Deck, whitepaper, video and media kit support the story instead of replacing it.

Our review journey pack, the current package now includes authentic browser screenshots and recordings captured from the public site.

Open showcase

AI Quant

Wallet journey

Recording pack

PREMIUM-ASSETS-030

Authentic product recordings are now part of the launch package.

The recording pack captures the current public website flows for homepage discovery, AI Quant, wallet education, business model review, Resources and Contact / Partner routing. It uses only public site content and keeps private implementation details out of the media layer.

Watch homepage flow

Open asset catalogue

Open manifest

AI Quant Workflow.

AI-native intelligence for Web3 decision context.

Captured from the public site package. No private code, credentials, wallet signing material or real user data appears in the recording.

Current

Public screenshot used from the live asset package.

L3AI Product Business Deck

04

AI Quant explains before action.

The AI Quant experience is positioned as research context and explanation, not trading automation or performance advice.

What the user gets

A guided research surface for market context, AI-assisted explanation and review language.

What it avoids

No personalized investment advice, no trading execution, no claimed predictive certainty.

Current **Explain-first**

Wallet-aware education stays public

The wallet experience can explain asset context without exposing protected or real balances in public materials.

- 1

Context, not custody
Wallet-aware pages can educate around asset context while staying outside custody claims.
- 2

Reviewable boundary
Public assets avoid real wallet signing material and protected account information.
- 3

Conversion support
The experience helps users understand what to review before qualified handoff.

Current public demo

Product modules reinforce one journey.

The business story works because modules point to the same outcome: better review before action.

AI Quant

Explain market context and limits.

Wallet

Educate around wallet-aware checkpoints.

Trust

Keep public claims and risks visible.

Resources

Give reviewers approved files.

Roadmap

Separate current, in-progress and planned capabilities.

Contact

Route qualified partner or customer review.

One platform story beats a collection of disconnected assets.

The matrix separates live capabilities from the roadmap.

Capability labels prevent the deck from presenting planned work as completed features.

Capability	Current	In Progress	Planned
Public website and resources	Yes	Polish	
AI Quant explanation flow	Yes	Depth	Expanded scoring
Wallet-aware education	Yes	UX polish	More integrations
Community progression		Design	Program launch
Automated production pipeline	Yes	QA hardening	More channels

The lifecycle keeps users moving without promising outcomes.

The user journey is designed around education, review and qualified handoff.

Progression is a content and education path unless a future program is separately approved.

The commercial model monetizes trusted product context.

The business loop connects audience, experience, trust and partner review without relying on

Core loop

Product experience creates trust. Trust improves review quality. Review quality supports partner and community growth.

Revenue logic stays evidence-gated.

The deck can describe revenue categories, but it should not invent metrics or imply approved forecasts.

Public resource package	Current	Website, deck, whitepaper, FAQ, media kit
Partner review path	Current	Qualified contact and enterprise use-case routing
Education-led programs	Planned	Community learning paths and progression model
Automation services	In Progress	Repeatable content, asset and validation workflow

Progression is framed as education, not payout.

Membership or progression logic should be shown only as an approved roadmap concept unless finalized for public launch.

Current

Users can follow public product pages, FAQ, resources and partner contact paths.

In Progress

Progression language can organize learning, review depth and community readiness.

Planned

Any membership mechanics, tiers or incentives require separate approval before public claims.

This protects the brand from reward-style overclaims while preserving the future growth path.

Community growth starts with useful review paths.

The public experience can attract users, partners and media by helping each group complete a specific review job.

- 1 Customers**
Understand the product and safety boundary before engagement.
- 2 Partners**
Review the commercial story and route qualified conversations.
- 3 Media**
Use approved language, screenshots and resource links.
- 4 Operators**
Verify manifests, links and public asset completeness.

Current review paths

Planned community programs

Automation makes public assets repeatable.

L3AI's content system can turn approved source facts into website pages, decks, video narratives, manifests and QA records.

Automation is valuable because it is controlled: source-backed, versioned and public-safe.

Video and media now follow the product story.

The next promo narrative should move from product problem to user journey, logic and review CTA.

- 1 Open with the user problem**
Confusing signals and weak trust slow Web3 decisions.
- 2 Show the product path**
Homepage, AI Quant, wallet education, resources and partner handoff.
- 3 Close with a review action**
Use the deck, whitepaper, demo and contact path for controlled external review.

Rewritten narrative included

Trust boundaries are a product feature.

The strongest public story is disciplined about what L3AI does and does not claim.

No outcome promises

External language must stay review-safe.

No protected source exposure

Public assets stay separated from protected systems.

No fake partner or traction metrics

Public assets stay separated from protected systems.

No funding instructions

External language must stay review-safe.

No protected system detail

Public assets stay separated from protected systems.

No wallet signing in public media

Public assets stay separated from protected systems.

Roadmap language separates Current, In Progress and Planned.

A mature external deck makes status visible instead of letting audiences guess.

Current

Public site and resources

AI Quant explanation page

Wallet-aware education page

Deck, whitepaper, media kit

In Progress

Creative polish

QA hardening

Deeper product recording

Automation governance

Planned

Community programs

Expanded integrations

Advanced motion package

Localized campaigns

GTM starts with the public site.

The launch motion routes audiences from public proof to the right resource and handoff.

Partner paths start with controlled review.

The right next step is not a broad promise. It is a qualified review package and a clear owner path.

Ecosystem partners

Review product fit, audience path and trust boundary.

Media reviewers

Use approved screenshots, FAQ and public wording.

Enterprise buyers

Assess production workflow, asset quality and governance.

Community operators

Evaluate education-led growth paths and roadmap status.

CTA: approve the 032 deck as the external story, then route partners through Resources and Contact.

The story is credible without invented metrics.

The deck relies on visible product surfaces, public artifacts, traceable manifests and explicit boundaries.

01

Visible product

Screenshots and pages already exist in the public package.

02

Controlled claims

No outcome, funding, protected data or protected-system claims.

03

Versioned assets

PPTX, PDF, HTML, notes, previews and manifests are traceable.

04

Status discipline

Current, In Progress and Planned language is separated.

Approve language before broad circulation.

The package is ready for controlled review, but final external use should follow product, legal and brand approvals.

- 1 Product owner**
Confirm current capability labels.
- 2 Legal and compliance**
Confirm public risk language.
- 3 Brand owner**
Confirm visual system and tone.
- 4 Release owner**
Confirm Resources links and asset package.

Controlled review package

Use the 032 package as the public story.

Open the product, review the business logic, verify the trust boundary, then route the right conversation.

打开产品、核查商业逻辑、确认边界，再进入合适的合作沟通。
